

**HIGHLIGHTS OF PRESCRIBING INFORMATION**

These highlights do not include all the information needed to use HAVRIX safely and effectively. See full prescribing information for HAVRIX.

**HAVRIX (Hepatitis A Vaccine)  
Suspension for Intramuscular Injection  
Initial U.S. Approval: 1995**

**INDICATIONS AND USAGE**

HAVRIX is a vaccine indicated for active immunization against disease caused by hepatitis A virus (HAV). HAVRIX is approved for use in persons 12 months of age or older. Primary immunization should be administered at least 2 weeks prior to expected exposure to HAV. (1)

**DOSAGE AND ADMINISTRATION**

- Children and adolescents: A single 0.5-mL dose and a 0.5-mL booster dose administered between 6 to 12 months later. (2.2)
- Adults: A single 1-mL dose and a 1-mL booster dose administered between 6 to 12 months later. (2.2)
- For intramuscular use only. (2.2)

**DOSAGE FORMS AND STRENGTHS**

- Suspension for injection available in the following presentations:
- 0.5-mL single-dose vials and prefilled syringes. (3)
- 1-mL single-dose vials and prefilled syringes. (3)

**CONTRAINDICATIONS**

Severe allergic reaction (e.g., anaphylaxis) after a previous dose of any hepatitis A-containing vaccine, or to any component of HAVRIX, including neomycin. (4)

**WARNINGS AND PRECAUTIONS**

HAVRIX is available in vials and 2 types of prefilled syringes. One type of prefilled syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a rubber plunger which contain dry natural latex rubber. Use of these syringes may cause allergic reactions in latex-sensitive individuals. (5.1, 16)

**ADVERSE REACTIONS**

- In studies of adults and children 2 years of age and older, the most common solicited adverse events were injection-site soreness (56% of adults and 21% of children) and headache (14% of adults and less than 9% of children). (6.1)
- In studies of children 11 to 25 months of age, the most frequently reported solicited local reactions were pain (32%) and redness (29%). Common solicited general adverse events were irritability (42%), drowsiness (28%), and loss of appetite (28%). (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact GlaxoSmithKline at 1-888-825-5249 or VAERS at 1-800-822-7967 or www.vaers.hhs.gov.

**DRUG INTERACTIONS**

Do not mix HAVRIX with any other vaccine or product in the same syringe or vial. (7.1)

**USE IN SPECIFIC POPULATIONS**

Safety and effectiveness of HAVRIX have not been established in pregnant women and nursing mothers. (8.1)

See 17 for PATIENT COUNSELING INFORMATION.

## FULL PRESCRIBING INFORMATION

### 1   **1    INDICATIONS AND USAGE**

2           HAVRIX<sup>®</sup> is indicated for active immunization against disease caused by hepatitis A  
3 virus (HAV). HAVRIX is approved for use in persons 12 months of age and older. Primary  
4 immunization should be administered at least 2 weeks prior to expected exposure to HAV.

### 5   **2    DOSAGE AND ADMINISTRATION**

#### 6   **2.1   Preparation for Administration**

7           Shake well before use. With thorough agitation, HAVRIX is a homogeneous, turbid,  
8 white suspension. Do not administer if it appears otherwise. Parenteral drug products should be  
9 inspected visually for particulate matter and discoloration prior to administration, whenever  
10 solution and container permit. If either of these conditions exists, the vaccine should not be  
11 administered.

#### 12   **2.2   Recommended Dose and Schedule**

13           HAVRIX should be administered by intramuscular injection only. HAVRIX should not  
14 be administered in the gluteal region; such injections may result in suboptimal response.

15           Children and Adolescents: Primary immunization for children and adolescents  
16 (12 months through 18 years of age) consists of a single 0.5-mL dose and a 0.5-mL booster dose  
17 administered anytime between 6 and 12 months later. The preferred sites for intramuscular  
18 injections are the anterolateral aspect of the thigh in young children or the deltoid muscle of the  
19 upper arm in older children.

20           Adults: Primary immunization for adults consists of a single 1-mL dose and a 1-mL  
21 booster dose administered anytime between 6 and 12 months later. In adults, the injection should  
22 be given in the deltoid region.

### 23   **3    DOSAGE FORMS AND STRENGTHS**

24           Suspension for injection available in the following presentations:

- 25   • 0.5-mL single-dose vials and prefilled TIP-LOK<sup>®</sup> syringes.
- 26   • 1-mL single-dose vials and prefilled TIP-LOK syringes.

### 27   **4    CONTRAINDICATIONS**

28           Severe allergic reaction (e.g., anaphylaxis) after a previous dose of any hepatitis A-  
29 containing vaccine, or to any component of HAVRIX, including neomycin, is a contraindication  
30 to administration of HAVRIX [*see Description (11)*].

31 **5 WARNINGS AND PRECAUTIONS**

32 **5.1 Latex**

33 HAVRIX is available in vials and 2 types of prefilled syringes. One type of prefilled  
34 syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a  
35 rubber plunger which contain dry natural latex rubber. Use of these syringes may cause allergic  
36 reactions in latex-sensitive individuals. The vial stopper does not contain latex. *[See How*  
37 *Supplied/Storage and Handling (16).]*

38 **5.2 Preventing and Managing Allergic Vaccine Reactions**

39 Appropriate medical treatment and supervision must be available to manage possible  
40 anaphylactic reactions following administration of the vaccine *[see Contraindications (4)].*

41 **5.3 Altered Immunocompetence**

42 Immunocompromised persons may have a diminished immune response to HAVRIX,  
43 including individuals receiving immunosuppressant therapy.

44 **5.4 Limitations of Vaccine Effectiveness**

45 Hepatitis A virus has a relatively long incubation period (15 to 50 days). HAVRIX may  
46 not prevent hepatitis A infection in individuals who have an unrecognized hepatitis A infection at  
47 the time of vaccination. Additionally, vaccination with HAVRIX may not protect all individuals.

48 **6 ADVERSE REACTIONS**

49 **6.1 Clinical Trials Experience**

50 Because clinical trials are conducted under widely varying conditions, adverse reaction  
51 rates observed in the clinical trials of a vaccine cannot be directly compared to rates in the  
52 clinical trials of another vaccine, and may not reflect the rates observed in practice.

53 The safety of HAVRIX has been evaluated in 61 clinical trials involving more than  
54 34,000 individuals receiving doses of 360 EL.U., 720 EL.U., or 1440 EL.U.

55 Of solicited adverse events in clinical trials of adults, who received HAVRIX  
56 1440 EL.U., and children (2 years of age and older), who received either HAVRIX 360 EL.U. or  
57 720 EL.U., the most frequently reported was injection-site soreness (56% of adults and 21% of  
58 children); less than 0.5% of soreness was reported as severe. Headache was reported by 14% of  
59 adults and less than 9% of children. Other solicited and unsolicited events occurring during  
60 clinical trials are listed below.

61 Incidence 1% to 10% of Injections: *Metabolism and Nutrition Disorders:* Anorexia.  
62 *Gastrointestinal Disorders:* Nausea.

63 *General Disorders and Administration Site Conditions:* Fatigue, fever >99.5°F  
64 (37.5°C), induration, redness, and swelling of the injection site; malaise.

65 Incidence <1% of Injections: *Infections and Infestations:* Pharyngitis, upper  
66 respiratory tract infections.

67 *Blood and Lymphatic System Disorders:* Lymphadenopathy.

68 *Psychiatric Disorders:* Insomnia.

69 *Nervous System Disorders:* Dysgeusia, hypertonia.

70 *Eye Disorders:* Photophobia.  
71 *Ear and Labyrinth Disorders:* Vertigo.  
72 *Gastrointestinal Disorders:* Abdominal pain, diarrhea, vomiting.  
73 *Skin and Subcutaneous Tissue Disorders:* Pruritus, rash, urticaria.  
74 *Musculoskeletal and Connective Tissue Disorders:* Arthralgia, myalgia.  
75 *General Disorders and Administration Site Conditions:* Injection site hematoma.  
76 *Investigations:* Creatine phosphokinase increased.

77 Studies of HAVRIX 720 EL.U./0.5 mL in Children 11 to 25 Months of Age: In 4  
78 studies, 3,152 children 11 to 25 months of age received at least one dose of HAVRIX 720 EL.U.  
79 administered alone or concomitantly with other routine childhood vaccinations [*see Clinical*  
80 *Studies (14.2, 14.5)*]. The studies included HAV 210 (N = 1,084), HAV 232 (N = 394),  
81 HAV 220 (N = 433), and HAV 231 (N = 1,241).

82 In the largest of these studies (HAV 231) conducted in the US, 1,241 children 15 months  
83 of age were randomized to receive: Group 1) HAVRIX alone; Group 2) HAVRIX concomitantly  
84 with measles, mumps, and rubella (MMR) vaccine (manufactured by Merck and Co.) and  
85 varicella vaccine (manufactured by Merck and Co.); or Group 3) MMR and varicella vaccines.  
86 Subjects in Group 3 who received MMR and varicella vaccines received the first dose of  
87 HAVRIX 42 days later. A second dose of HAVRIX was administered to all subjects 6 to  
88 9 months after the first dose of HAVRIX. Solicited local adverse reactions and general events  
89 were recorded by parents/guardians on diary cards for 4 days (days 0 to 3) after vaccination.  
90 Unsolicited adverse events were recorded on the diary card for 31 days after vaccination.  
91 Telephone follow-up was conducted 6 months after the last vaccination to inquire about serious  
92 adverse events, new onset chronic illnesses and medically significant events. A total of 1,035  
93 children completed the 6-month follow-up. Among subjects in all groups combined, 53% were  
94 male; 69% of subjects were white, 16% were Hispanic, 9% were black and 6% were other  
95 racial/ethnic groups.

96 Percentages of subjects with solicited local adverse reactions and general adverse events  
97 following HAVRIX administered alone (Group 1) or concomitantly with MMR and varicella  
98 vaccines (Group 2) are presented in Table 1. The solicited adverse events from the 3 additional  
99 coadministration studies conducted with HAVRIX were comparable to those from Study  
100 HAV 231.

101

102 **Table 1. Solicited Local Adverse Reactions and General Adverse Events Occurring Within**  
 103 **4 Days of Vaccination<sup>a</sup> in Children 15 to 24 Months of Age With HAVRIX Administered**  
 104 **Alone or Concomitantly With MMR and Varicella Vaccines (TVC)**

	<b>Group 1 HAVRIX Dose 1 %</b>	<b>Group 2 HAVRIX+ MMR+V<sup>b</sup> Dose 1 %</b>	<b>Group 1 HAVRIX Dose 2 %</b>	<b>Group 2 HAVRIX Dose 2 %</b>
<b>Local (at injection site for HAVRIX)</b>				
N	298	411	272	373
Pain, any	23.8	23.6	24.3	30.3
Redness, any	20.1	20.0	22.8	23.9
Swelling, any	8.7	10.2	9.6	9.9
<b>General</b>				
N	300	417	271	375
Irritability, any	33.3	43.9	31.0	27.2
Irritability, grade 3	0.3	1.9	1.5	0.3
Drowsiness, any	22.3	35.3	21.0	20.8
Drowsiness, grade 3	1.0	2.2	1.1	0.0
Loss of appetite, any	18.3	26.1	19.9	20.5
Loss of appetite, grade 3	1.0	1.4	0.4	0.3
Fever ≥100.6°F (38.1°C)	3.0	4.8	3.3	2.7
Fever ≥101.5°F (38.6°C)	2.0	2.6	1.8	1.6
Fever ≥102.4°F (39.1°C)	0.7	0.7	0.4	1.1

105 Total vaccinated cohort (TVC) = all subjects who received at least one dose of vaccine.

106 N = number of subjects who received at least one dose of vaccine and for whom diary card information  
 107 was available.

108 Grade 3: drowsiness defined as prevented normal daily activities; irritability/fussiness defined as crying  
 109 that could not be comforted/prevented normal daily activities; loss of appetite defined as no eating at  
 110 all.

111 <sup>a</sup> Within 4 days of vaccination defined as day of vaccination and the next 3 days.

112 <sup>b</sup> MMR = measles, mumps, and rubella vaccine; V = varicella vaccine.

113  
 114 *Serious Adverse Events in Children 11 to 25 Months of Age:* Among these 4  
 115 studies, 0.9% (29/3,152) of subjects reported a serious adverse event within the 31-day period  
 116 following vaccination with HAVRIX. Among subjects administered HAVRIX alone 1.0%  
 117 (13/1,332) reported a serious adverse event. Among subjects who received HAVRIX  
 118 concomitantly with other childhood vaccines, 0.9% (8/909) reported a serious adverse event. In  
 119 these 4 studies, there were 4 reports of seizure within 31 days post-vaccination: these occurred 2,  
 120 9, and 27 days following the first dose of HAVRIX administered alone and 12 days following

121 the second dose of HAVRIX. In one subject who received INFANRIX and Hib conjugate  
122 vaccine followed by HAVRIX 6 weeks later, bronchial hyperreactivity and respiratory distress  
123 were reported on the day of administration of HAVRIX alone.

## 124 **6.2 Postmarketing Experience**

125 In addition to reports in clinical trials, worldwide voluntary reports of adverse events  
126 received for HAVRIX since market introduction of this vaccine are listed below. This list  
127 includes serious adverse events or events which have a suspected causal connection to  
128 components of HAVRIX or other vaccines or drugs. Because these events are reported  
129 voluntarily from a population of uncertain size, it is not always possible to reliably estimate their  
130 frequency or establish a causal relationship to the vaccine.

131 Infections and Infestations: Rhinitis.

132 Blood and Lymphatic System Disorders: Thrombocytopenia.

133 Immune System Disorders: Anaphylactic reaction, anaphylactoid reaction, serum  
134 sickness-like syndrome.

135 Nervous System Disorders: Convulsion, dizziness, encephalopathy, Guillain-Barré  
136 syndrome, hypoesthesia, multiple sclerosis, myelitis, neuropathy, paresthesia, somnolence,  
137 syncope.

138 Vascular Disorders: Vasculitis.

139 Respiratory, Thoracic, and Mediastinal Disorders: Dyspnea.

140 Hepatobiliary Disorders: Hepatitis, jaundice.

141 Skin and Subcutaneous Tissue Disorders: Angioedema, erythema multiforme,  
142 hyperhidrosis.

143 Congenital, Familial, and Genetic Disorders: Congenital anomaly.

144 Musculoskeletal and Connective Tissue Disorders: Musculoskeletal stiffness.

145 General Disorders and Administration Site Conditions: Chills, influenza-like  
146 symptoms, injection site reaction, local swelling.

## 147 **7 DRUG INTERACTIONS**

### 148 **7.1 Concomitant Administration With Vaccines and Immune Globulin**

149 In clinical studies HAVRIX was administered concomitantly with the following vaccines  
150 [*see Adverse Reactions (6.1) and Clinical Studies (14.5)*]:

- 151 • INFANRIX (DTaP);
- 152 • Hib conjugate vaccine;
- 153 • pneumococcal 7-valent conjugate vaccine;
- 154 • MMR vaccine;
- 155 • varicella vaccine.

156 HAVRIX may be administered concomitantly with immune globulin.

157 When concomitant administration of other vaccines or immune globulin is required, they  
158 should be given with different syringes and at different injection sites. Do not mix HAVRIX with  
159 any other vaccine or product in the same syringe or vial.

160 **7.2 Immunosuppressive Therapies**

161 Immunosuppressive therapies, including irradiation, antimetabolites, alkylating agents,  
162 cytotoxic drugs, and corticosteroids (used in greater than physiologic doses), may reduce the  
163 immune response to HAVRIX.

164 **8 USE IN SPECIFIC POPULATIONS**

165 **8.1 Pregnancy**

166 Pregnancy Category C

167 Animal reproduction studies have not been conducted with HAVRIX. It is also not  
168 known whether HAVRIX can cause fetal harm when administered to a pregnant woman or can  
169 affect reproduction capacity. HAVRIX should be given to a pregnant woman only if clearly  
170 needed.

171 **8.3 Nursing Mothers**

172 It is not known whether HAVRIX is excreted in human milk. Because many drugs are  
173 excreted in human milk, caution should be exercised when HAVRIX is administered to a nursing  
174 woman.

175 **8.4 Pediatric Use**

176 The safety and effectiveness of HAVRIX, doses of 360 EL.U. or 720 EL.U., have been  
177 evaluated in more than 22,000 subjects 1 year to 18 years of age.

178 The safety and effectiveness of HAVRIX have not been established in subjects younger  
179 than 12 months of age.

180 **8.5 Geriatric Use**

181 Clinical studies of HAVRIX did not include sufficient numbers of subjects 65 years of  
182 age and older to determine whether they respond differently from younger subjects. Other  
183 reported clinical experience has not identified differences in overall safety between these  
184 subjects and younger adult subjects.

185 **8.6 Hepatic Impairment**

186 Subjects with chronic liver disease had a lower antibody response to HAVRIX than  
187 healthy subjects [*see Clinical Studies (14.3)*].

188 **11 DESCRIPTION**

189 HAVRIX (Hepatitis A Vaccine) is a sterile suspension of inactivated virus for  
190 intramuscular administration. The virus (strain HM175) is propagated in MRC-5 human diploid  
191 cells. After removal of the cell culture medium, the cells are lysed to form a suspension. This  
192 suspension is purified through ultrafiltration and gel permeation chromatography procedures.  
193 Treatment of this lysate with formalin ensures viral inactivation. Viral antigen activity is  
194 referenced to a standard using an enzyme linked immunosorbent assay (ELISA), and is therefore  
195 expressed in terms of ELISA Units (EL.U.).

196 Each 1-mL adult dose of vaccine contains 1440 EL.U. of viral antigen, adsorbed on  
197 0.5 mg of aluminum as aluminum hydroxide.

198 Each 0.5-mL pediatric dose of vaccine contains 720 EL.U. of viral antigen, adsorbed onto  
199 0.25 mg of aluminum as aluminum hydroxide.

200 HAVRIX contains the following excipients: Amino acid supplement (0.3% w/v) in a  
201 phosphate-buffered saline solution and polysorbate 20 (0.05 mg/mL). From the manufacturing  
202 process, HAVRIX also contains residual MRC-5 cellular proteins (not more than 5 mcg/mL),  
203 formalin (not more than 0.1 mg/mL), and neomycin sulfate (not more than 40 ng/mL), an  
204 aminoglycoside antibiotic included in the cell growth media.

205 HAVRIX is formulated without preservatives.

206 HAVRIX is available in vials and 2 types of prefilled syringes. One type of prefilled  
207 syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a  
208 rubber plunger which contain dry natural latex rubber. The vial stopper does not contain latex.  
209 *[See How Supplied/Storage and Handling (16).]*

## 210 **12 CLINICAL PHARMACOLOGY**

### 211 **12.1 Mechanism of Action**

212 The hepatitis A virus belongs to the picornavirus family. It is one of several hepatitis  
213 viruses that cause systemic disease with pathology in the liver.

214 The incubation period for hepatitis A averages 28 days (range: 15 to 50 days).<sup>1</sup> The  
215 course of hepatitis A infection is extremely variable, ranging from asymptomatic infection to  
216 icteric hepatitis and death.

217 The presence of antibodies to HAV confers protection against hepatitis A infection.  
218 However, the lowest titer needed to confer protection has not been determined.

## 219 **13 NONCLINICAL TOXICOLOGY**

### 220 **13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility**

221 HAVRIX has not been evaluated for its carcinogenic potential, mutagenic potential, or  
222 potential for impairment of fertility.

## 223 **14 CLINICAL STUDIES**

### 224 **14.1 Pediatric Effectiveness Studies**

225 Protective efficacy with HAVRIX has been demonstrated in a double-blind, randomized  
226 controlled study in school children (age 1 to 16 years) in Thailand who were at high risk of HAV  
227 infection. A total of 40,119 children were randomized to be vaccinated with either HAVRIX  
228 360 EL.U. or ENGERIX-B 10 mcg at 0, 1, and 12 months. Of these, 19,037 children received 2  
229 doses of HAVRIX (0 and 1 months) and 19,120 children received 2 doses of control vaccine,  
230 ENGERIX-B (0 and 1 months). A total of 38,157 children entered surveillance at day 138 and  
231 were observed for an additional 8 months. Using the protocol-defined endpoint ( $\geq 2$  days absence  
232 from school, ALT level  $>45$  U/mL, and a positive result in the HAVAB-M test), 32 cases of  
233 clinical hepatitis A occurred in the control group. In the HAVRIX group, 2 cases were identified.  
234 These 2 cases were mild in terms of both biochemical and clinical indices of hepatitis A disease.

235 Thus the calculated efficacy rate for prevention of clinical hepatitis A was 94% (95% Confidence  
236 Interval [CI]: 74, 98).

237 In outbreak investigations occurring in the trial, 26 clinical cases of hepatitis A (of a total  
238 of 34 occurring in the trial) occurred. No cases occurred in vaccinees who received HAVRIX.

239 Using additional virological and serological analyses post hoc, the efficacy of HAVRIX  
240 was confirmed. Up to 3 additional cases of mild clinical illness may have occurred in vaccinees.  
241 Using available testing, these illnesses could neither be proven nor disproven to have been  
242 caused by HAV. By including these as cases, the calculated efficacy rate for prevention of  
243 clinical hepatitis A would be 84% (95% CI: 60, 94).

## 244 **14.2 Immunogenicity in Children and Adolescents**

245 Immune Response to HAVRIX 720 EL.U./0.5 mL at 11 to 25 Months of Age  
246 (Study HAV 210): In this prospective, open-label, multicenter study, 1,084 children were  
247 administered study vaccine in one of 5 groups:

248 (1) Children 11 to 13 months of age who received HAVRIX on a 0- and 6-month  
249 schedule;

250 (2) Children 15 to 18 months of age who received HAVRIX on a 0- and 6-month  
251 schedule;

252 (3) Children 15 to 18 months of age who received HAVRIX coadministered with  
253 INFANRIX and Haemophilus b (Hib) conjugate vaccine (no longer US-licensed) at month 0 and  
254 HAVRIX at month 6;

255 (4) Children 15 to 18 months of age who received INFANRIX coadministered with Hib  
256 conjugate vaccine at month 0 and HAVRIX at months 1 and 7;

257 (5) Children 23 to 25 months of age who received HAVRIX on a 0- and 6-month  
258 schedule.

259 Among subjects in all groups, 52% were male; 61% of subjects were white, 9% were  
260 black, 3% were Asian, and 27% were other racial/ethnic groups. The anti-hepatitis A antibody  
261 vaccine responses and GMTs, calculated on responders for groups 1, 2, and 5 are presented in  
262 Table 2. Vaccine response rates were similar among the 3 age groups that received HAVRIX.  
263 One month after the second dose of HAVRIX, the GMT in each of the younger age groups (11 to  
264 13 and 15 to 18 months of age) was shown to be similar to that achieved in the 23 to 25 months  
265 of age group.

266

267 **Table 2. Anti-Hepatitis A Immune Response Following 2 Doses of HAVRIX**  
 268 **720 EL.U./0.5 mL Administered 6 Months Apart in Children Given the First Dose of**  
 269 **HAVRIX at 11 to 13 Months of Age, 15 to 18 Months of Age, or 23 to 25 Months of Age**

Age group	N	Vaccine Response		GMT (mIU/mL)
		%	95% CI	
11-13 months (Group 1)	218	99	97, 100	1,461 <sup>a</sup>
15-18 months (Group 2)	200	100	98, 100	1,635 <sup>a</sup>
23-25 months (Group 5)	211	100	98, 100	1,911

270 Vaccine response = Seroconversion (anti-HAV  $\geq 15$  mIU/mL [lower limit of antibody  
 271 measurement by assay]) in children initially seronegative or at least the maintenance of the  
 272 pre-vaccination anti-HAV concentration in initially seropositive children.

273 CI = Confidence Interval; GMT = Geometric mean antibody titer.

274 <sup>a</sup> Calculated on vaccine responders one month post-dose 2. GMTs in children 11 to 13 months  
 275 of age and 15 to 18 months of age were non-inferior (similar) to the GMT in children 23 to  
 276 25 months of age (i.e., the lower limit of the two-sided 95% CI on the GMT ratio for  
 277 Group 1/Group 5 and for Group 2/Group 5 were both  $\geq 0.5$ ).

278  
 279 In 3 additional clinical studies (HAV 232, HAV 220, and HAV 231), children received  
 280 either 2 doses of HAVRIX alone or the first dose of HAVRIX concomitantly administered with  
 281 other routinely recommended US-licensed vaccines followed by a second dose of HAVRIX.  
 282 After the second dose of HAVRIX, there was no evidence for interference with the anti-HAV  
 283 response in the children who received concomitantly administered vaccines compared to those  
 284 who received HAVRIX alone. [See *Adverse Reactions (6.1) and Clinical Studies (14.5).*]

285 Immune Response to HAVRIX 360 EL.U. Among Individuals 2 to 18 Years of  
 286 Age: In 6 clinical studies, 762 subjects 2 to 18 years of age received 2 doses of HAVRIX  
 287 (360 EL.U.) given 1 month apart (GMT ranged from 197 to 660 mIU/mL). Ninety-nine percent  
 288 of subjects seroconverted following 2 doses. When a third dose of HAVRIX 360 EL.U. was  
 289 administered 6 months following the initial dose, all subjects were seropositive (anti-HAV  
 290  $\geq 20$  mIU/mL) 1 month following the third dose, with GMTs rising to a range of 3,388 to  
 291 4,643 mIU/mL. In 1 study in which children were followed for an additional 6 months, all  
 292 subjects remained seropositive.

293 Immune Response to HAVRIX 720 EL.U./0.5 mL Among Individuals 2 to 19  
 294 Years of Age: In 4 clinical studies, 314 children and adolescents ranging from 2 to 19 years of  
 295 age were immunized with 2 doses of HAVRIX 720 EL.U./0.5 mL given 6 months apart. One  
 296 month after the first dose, seroconversion (anti-HAV  $\geq 20$  mIU/mL [lower limit of antibody  
 297 measurement by assay]) ranged from 96.8% to 100%, with GMTs of 194 mIU/mL to  
 298 305 mIU/mL. In studies in which sera were obtained 2 weeks following the initial dose,  
 299 seroconversion ranged from 91.6% to 96.1%. One month following the booster dose at month 6,  
 300 all subjects were seropositive, with GMTs ranging from 2,495 mIU/mL to 3,644 mIU/mL.

301 In an additional study in which the booster dose was delayed until 1 year following the  
302 initial dose, 95.2% of the subjects were seropositive just prior to administration of the booster  
303 dose. One month later, all subjects were seropositive, with a GMT of 2,657 mIU/mL.

### 304 **14.3 Immunogenicity in Adults**

305 More than 400 healthy adults 18 to 50 years of age in 3 clinical studies were given a  
306 single 1440 EL.U. dose of HAVRIX. All subjects were seronegative for hepatitis A antibodies at  
307 baseline. Specific humoral antibodies against HAV were elicited in more than 96% of subjects  
308 when measured 1 month after vaccination. By day 15, 80% to 98% of vaccinees had already  
309 seroconverted (anti-HAV  $\geq 20$  mIU/mL [lower limit of antibody measurement by assay]). GMTs  
310 of seroconverters ranged from 264 to 339 mIU/mL at day 15 and increased to a range of 335 to  
311 637 mIU/mL by 1 month following vaccination.

312 The GMTs obtained following a single dose of HAVRIX are at least several times higher  
313 than that expected following receipt of immune globulin.

314 In a clinical study using 2.5 to 5 times the standard dose of immune globulin (standard  
315 dose = 0.02 to 0.06 mL/kg), the GMT in recipients was 146 mIU/mL at 5 days  
316 post-administration, 77 mIU/mL at month 1, and 63 mIU/mL at month 2.

317 In 2 clinical trials in which a booster dose of 1440 EL.U. was given 6 months following  
318 the initial dose, 100% of vaccinees (n = 269) were seropositive 1 month after the booster dose,  
319 with GMTs ranging from 3,318 mIU/mL to 5,925 mIU/mL. The titers obtained from this  
320 additional dose approximate those observed several years after natural infection.

321 In a subset of vaccinees (n = 89), a single dose of HAVRIX 1440 EL.U. elicited specific  
322 anti-HAV neutralizing antibodies in more than 94% of vaccinees when measured 1 month after  
323 vaccination. These neutralizing antibodies persisted until month 6. One hundred percent of  
324 vaccinees had neutralizing antibodies when measured 1 month after a booster dose given at  
325 month 6.

326 Immunogenicity of HAVRIX was studied in subjects with chronic liver disease of  
327 various etiologies. 189 healthy adults and 220 adults with either chronic hepatitis B (n = 46),  
328 chronic hepatitis C (n = 104), or moderate chronic liver disease of other etiology (n = 70) were  
329 vaccinated with HAVRIX 1440 EL.U. on a 0- and 6-month schedule. The last group consisted of  
330 alcoholic cirrhosis (n = 17), autoimmune hepatitis (n = 10), chronic hepatitis/cryptogenic  
331 cirrhosis (n = 9), hemochromatosis (n = 2), primary biliary cirrhosis (n = 15), primary sclerosing  
332 cholangitis (n = 4), and unspecified (n = 13). At each time point, geometric mean antibody titers  
333 (GMTs) were lower for subjects with chronic liver disease than for healthy subjects. At month 7,  
334 the GMTs ranged from 478 mIU/mL (chronic hepatitis C) to 1,245 mIU/mL (healthy). One  
335 month after the first dose, seroconversion rates in adults with chronic liver disease were lower  
336 than in healthy adults. However, 1 month after the booster dose at month 6, seroconversion rates  
337 were similar in all groups; rates ranged from 94.7% to 98.1%. The relevance of these data to the  
338 duration of protection afforded by HAVRIX is unknown.

339 In subjects with chronic liver disease, local injection site reactions with HAVRIX were  
340 similar among all 4 groups, and no serious adverse events attributed to the vaccine were reported  
341 in subjects with chronic liver disease.

#### 342 **14.4 Duration of Immunity**

343 The duration of immunity following a complete schedule of immunization with HAVRIX  
344 has not been established.

#### 345 **14.5 Immune Response to Concomitantly Administered Vaccines**

346 In 3 clinical studies HAVRIX was administered concomitantly with other routinely  
347 recommended US-licensed vaccines: Study HAV 232: Diphtheria and tetanus toxoids and  
348 acellular pertussis vaccine adsorbed (INFANRIX, DTaP) and Haemophilus b (Hib) conjugate  
349 vaccine (tetanus toxoid conjugate) (manufactured by sanofi pasteur SA); Study HAV 220:  
350 Pneumococcal 7-valent conjugate vaccine (PCV-7) (manufactured by Pfizer), and Study  
351 HAV 231: MMR and varicella vaccines. [See Adverse Reactions (6.1).]

##### 352 Concomitant Administration With DTaP and Hib Conjugate Vaccine (Study

353 HAV 232): In this US multicenter study, 468 subjects, children 15 months of age were  
354 randomized to receive: Group 1) HAVRIX coadministered with INFANRIX and Hib conjugate  
355 vaccine (n = 127); Group 2) INFANRIX and Hib conjugate vaccine alone followed by a first  
356 dose of HAVRIX one month later (n = 132); or Group 3) HAVRIX alone (n = 135). All subjects  
357 received a second dose of HAVRIX alone 6 to 9 months following the first dose. Among  
358 subjects in all groups combined, 53% were male; 64% of subjects were white, 12% were black,  
359 6% were Hispanic, and 18% were other racial/ethnic groups.

360 There was no evidence for reduced antibody response to diphtheria and tetanus toxoids  
361 (percentage of subjects with antibody levels  $\geq 0.1$  mIU/mL to each antigen), pertussis antigens  
362 (percentage of subjects with seroresponse, antibody concentrations  $\geq 5$  EL.U./mL in seronegative  
363 subjects or post-vaccination antibody concentration  $\geq 2$  times the pre-vaccination antibody  
364 concentration in seropositive subjects, and GMTs), or Hib (percentage of subjects with antibody  
365 levels  $\geq 1$  mcg/mL to polyribosyl-ribitol phosphate, PRP) when HAVRIX was administered  
366 concomitantly with INFANRIX and Hib conjugate vaccine (Group 1) relative to INFANRIX and  
367 Hib conjugate vaccine administered together (Group 2).

##### 368 Concomitant Administration With Pneumococcal 7-Valent Conjugate Vaccine

369 (Study HAV 220): In this US multicenter study, 433 children 15 months of age were  
370 randomized to receive: Group 1) HAVRIX coadministered with PCV-7 vaccine (n = 137); Group  
371 2) HAVRIX administered alone (n = 147); or Group 3) PCV-7 vaccine administered alone  
372 (n = 149) followed by a first dose of HAVRIX one month later. All subjects received a second  
373 dose of HAVRIX 6 to 9 months after the first dose. Among subjects in all groups combined,  
374 53% were female; 61% of subjects were white, 16% were Hispanic, 15% were black, and 8%  
375 were other racial/ethnic groups.

376 There was no evidence for reduced antibody response to PCV-7 (GMC to each serotype)  
377 when HAVRIX was administered concomitantly with PCV-7 vaccine (Group 1) relative to PCV-  
378 7 administered alone (Group 3).

379 Concomitant Administration With MMR and Varicella Vaccines (Study HAV 231):  
380 In a US multicenter study, there was no evidence for interference in the immune response to  
381 MMR and varicella vaccines (the percentage of subjects with pre-specified  
382 seroconversion/seroresponse levels) administered at 15 months of age concomitantly with  
383 HAVRIX relative to the response when MMR and varicella vaccines are administered without  
384 HAVRIX. [See Adverse Reactions (6.1).]

387 passive immunization: Recommendations of the Immunization Practices Advisory  
388 Committee (ACIP). *MMWR* 2006;55(RR-7):1-23.

## 389 **16 HOW SUPPLIED/STORAGE AND HANDLING**

390 HAVRIX is available in single-dose vials (contain no latex) and prefilled TIP-LOK  
391 syringes (may contain latex) (packaged without needles) (Preservative Free Formulation):  
392 720 EL.U./0.5 mL  
393 NDC 58160-825-01 Vial (contains no latex) in Package of 10: NDC 58160-825-11  
394 NDC 58160-825-43 Syringe (tip cap may contain latex) in Package of 10: NDC 58160-825-52  
395 NDC 58160-825-41 Syringe (tip cap and plunger contain latex) in Package of 5: NDC 58160-  
396 825-46  
397 NDC 58160-825-41 Syringe (tip cap and plunger contain latex) in Package of 10: NDC 58160-  
398 825-51  
399 1440 EL.U./mL  
400 NDC 58160-826-01 Vial (contains no latex) in Package of 10: NDC 58160-826-11  
401 NDC 58160-826-43 Syringe (tip cap may contain latex) in Package of 5: NDC 58160-826-48  
402 NDC 58160-826-32 Syringe (tip cap and plunger contain latex) in Package of 1: NDC 58160-  
403 826-32  
404 NDC 58160-826-41 Syringe (tip cap and plunger contain latex) in Package of 5: NDC 58160-  
405 826-46  
406 Store refrigerated between 2° and 8°C (36° and 46°F). Do not freeze. Discard if the  
407 vaccine has been frozen. Do not dilute to administer.

## 408 **17 PATIENT COUNSELING INFORMATION**

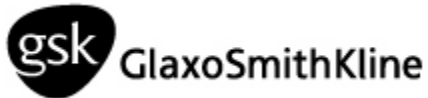

- 409 • Inform vaccine recipients and parents or guardians of the potential benefits and risks of  
410 immunization with HAVRIX.  
411 • Emphasize, when educating vaccine recipients and parents or guardians regarding potential  
412 side effects, that HAVRIX contains non-infectious killed viruses and cannot cause hepatitis  
413 A infection.  
414 • Instruct vaccine recipients and parents or guardians to report any adverse events to their  
415 healthcare provider.

- 416 • Give vaccine recipients and parents or guardians the Vaccine Information Statements, which  
417 are required by the National Childhood Vaccine Injury Act of 1986 to be given prior to  
418 immunization. These materials are available free of charge at the Centers for Disease Control  
419 and Prevention (CDC) website ([www.cdc.gov/vaccines](http://www.cdc.gov/vaccines)).
